

APPENDIX

PRO7000 DC Motor Operator
Manual forces, automatic limits
New learn switch for learning the limits

Code based on Flex GDO

Notes:

- Motor is controlled via two Form C relays to control direction
- Motor speed is controlled via a fet (2 IRF540's in parallel) with a phase control PWM applies.
- Wall control (and RS232) are P98 with a redundant smart button and command button on the logic board

Flex GDO Logic Board

Fixed AND Rolling Code Functionality
Learn from keyless entry transmitter
Posi-lock

Turn on light from broken IR beam (when at up limit)

Keyless entry temporary password based on number of hours or number of activations. (Rolling code mode only)

GDO is initialized to a 'clean slate' mode when the memory is erased. In this mode, the GDO will receive either fixed or rolling codes. When the first radio code is learned, the GDO locks itself into that mode (fixed or rolling) until the memory is again erased.

Rolling code derived from the Leaded67 code
Using the 8K zilog 233 chip
Timer interrupt needed to be 2X faster

Revision History

Revision 1.1:

- Changed light from broken IR beam to work in both fixed and rolling modes.
- Changed light from IR beam to work only on beam break, not on beam block.

Revision 1.2:

- Learning rolling code formerly erased fixed code. Mode is now determined by first transmitter learned after radio erase.

Revision 1.3:

- Moved radio interrupt disable to reception of 20 bits.
- Changed mode of radio switching. Formerly toggled upon radio error, now switches in pseudo-random fashion depending upon value of 125 ms timer.

Revision 1.4:

- Optimized portion of radio after bit value is determined. Used relative addressing to speed code and minimize ROM size.

Revision 1.5:

- Changed mode of learning transmitters. Learn command is now light-command, learn light is now light-lock, and learn open/close/stop is lock-command. (Command was press light, press command, release light, release command, worklight was press light, press command, release command, release light, o/c/s was press lock, press command, release command, release lock. This caused DOG2 to reset)

```

; Revision 1.6:
; -- Light button and light transmitter now ignored during travel.
; Switch data cleared only after a command switch is checked.
;
; Revision 1.7:
; -- Rejected fixed mode (and fixed mode test) when learning light and
; open/close/stop transmitters.
;
; Revision 1.8:
; -- Changed learn from wall control to work only when both switches are
; held. Modified force pot. read routine (moved enabling of blank
; time and disabling of interrupts). Fixed mode now learns command
; with any combination of wall control switches.
;
; Revision 1.9:
; -- Changed PWM output to go from 0-50% duty cycle. This eliminated the
; problem of PWM interrupts causing problems near 100% duty cycle.
; THIS REVISION REQUIRES A HARDWARE CHANGE.
;
; Revision 1.9A:
; -- Enabled ROM checksum. Cleaned up documentation.
;
; Revision 2.0:
; -- Blank time noise immunity. If noise signal is detected during blank time the data
; already recieved is not thrown out. The data is retained, and the noise
; pulse is identified as such. The interrupt is enabled to contine to look
; for the sync pulse.
;
; Revision 2.0A:
; -- On the event that the noise pulse is of the same duration as the sync pulse,
; the time between sync and first data pulse (inactive time) is measured. The
; inactive time is 5.14ms for billion code and 2.4ms for rolling code. If it is
; determined that the previously received sync is indeed a noise pulse, the pulse
; is thrown out and the micro continues to look for a sync pulse as in Rev. 2.0.
;
; Revision 2.1:
; -- To make the blank time more impervious to noise, the sync pulses are
; differentiated between. Fixed max width is 4.6ms, roll max width is 2.3ms.
; This is simular to the inactive time check done in Rev.2.0A.
;
; Revision 2.2:
; -- The worklight function; when the IR beam is broken and the door is at the up limit
; the light will turn on for 4.5 min. This revision allows the worklight function to
; be enabled and disabled by the user. The function will come enabled from the factory.
; To disable, with the light off press and hold the light button for 7 sec. The light will
; come on and after 7 sec. the function is disabled the light will turn off. To enable the
; function, turn the light on, release the button, then press and hold the light button
; down for 7 sec. The light will turn off and after the function has been enable in 7 sec.
; the light will turn on.
;
; Revision 3.0:
; -- Integrated in functionality for Siminor rolling code transmitter. The Siminor
; transmitter may be received whenever a C code transmitter may be received.
; Siminor transmitters are able to perform as a standard command or as a light
; control transmitter, but not as an open/close/stop transmitter.
;
; Revision 3.1:
; -- Modified handling of rolling code counter (in mirroring and adding) to improve
; efficiency and hopefully kill all short cycles when a radio is jammed on the
; air.
;
;-----
; PRO7000
;-----
;
; Revision 0.1:
; -- Removed physical limit tests
; -- Disabled radio temporarily
; -- Put in sign bit test for limits
; -- Automatic limits working
;

```

```

; Revision 0.2:
; -- Provided for traveling up when too close to limit
;
; Revision 0.3:
; -- Changed force pot. read to new routine.
; -- Disabled T1 interrupt and all old force pot. code
; -- Disabled all RS232 output
;
; Revision 0.4:
; -- Added in (veerrrry) rough force into pot. read routine
;
; Revision 0.5:
; -- Changed EEPROM in comments to add in up limit, last operation, and
;   down limit.
; -- Created OnePass register
; -- Added in limit read from nonvolatile when going to a moving state
; -- Added in limit read on power-up
; -- Created passcounter register to keep track of pass point(s)
; -- Installed basic wake-up routine to restore position based on last state
;
; Revision 0.6:
; -- Changed RPM time read to routine used in P98 to save RAM
; -- Changed operation of RPM forced up travel
; -- Implemented pass point for one-pass-point travel
;
; Revision 0.7:
; -- Changed pass point from single to multiple (no EEPROM support)
;
; Revision 0.8:
; -- Changed all SKIPRADIO loads from 0xFF to NOEECOMM
; -- Installed EEPROM support for multiple pass points
;
; Revision 0.9:
; -- Changed state machine to handle wake-up (i.e. always head towards
;   the lowest pass point to re-orient the GDO)
;
; Revision 0.10:
; -- Changed the AC line input routine to work off full-wave rectified
;   AC coming in
;
; Revision 0.11:
; -- Installed the phase control for motor speed control
;
; Revision 0.12:
; -- Installed traveling down if too near up limit
; -- Installed speed-up when starting travel
; -- Installed slow-down when ending travel
;
; Revision 0.13:
; -- Re-activated the C code
;
; Revision 0.14:
; -- Added in conditional assembly for Siminor radio codes
;
; Revision 0.15:
; -- Disabled old wall control code
; -- Changed all pins to conform with new layout
; -- Removed unused constants
; -- Commented out old wall control routine
; -- Changed code to run at 6MHz
;
; Revision 0.16
; -- Fixed bugs in Flex radio
;
; Revision 0.17
; -- Re-enabled old wall control. Changed command charging time to 12 ms
;   to fix FMEA problems with IR protectors.
;
; Revision 0.18

```

```

; -- Turned on learn switch connected to EEPROM clock line
;
; Revision 0.19
; -- Eliminated unused registers
; -- Moved new registers out of radio group
; -- Re-enabled radio interrupt
;
; Revision 0.20
; -- Changed limit test to account for "lost" position
; -- Re-wrote pass point routine
;
; Revision 0.21
; -- Changed limit tests in state setting routines
; -- Changed criteria for looking for lost position
; -- Changed lost operation to stop until position is known
;
; Revision 0.22:
; -- Added in L_A_C state machine to learn the limits
; -- Installed learn-command to go into LAC mode
; -- Added in command button and learn button jog commands
; -- Disabled limit testing when in learn mode
; -- Added in LED flashing for in learn mode
; -- Added in EVERYTHING with respect to learning limits
; -- NOTE: LAC still isn't working properly!!!
;
; Revision 0.23:
; -- Added in RS232 functionality over wall control lines
;
; Revision 0.24:
; -- Touched up RS232 over wall control routine
; -- Removed 50Hz force table
; -- Added in fixes to LAC state machine
;
; Revision 0.25:
; -- Added switch set and release for wall control (NOT smart switch)
; -- into RS232 commands (Turned debouncer set and release in to subs)
; -- Added smart switch into RS232 commands (smart switch is also a sub)
; -- Re-enabled pass point test in ':' RS232 command
; -- Disabled smart switch scan when in RS232 mode
; -- Corrected relative references in debouncer subroutines
; -- RS232 'F' command still needs to be fixed
;
; Revision 0.26:
; -- Added in max. force operation until motor ramp-up is done
; -- Added in clearing of slowdown flag in set_any routine
; -- Changed RPM timeout from 30 to 60 ms
;
; Revision 0.27:
; -- Switched phase control to off, then on (was on, then off) inside
; -- each half cycle of the AC line (for noise reduction)
; -- Changed from 40ms unit max. period to 32 (will need further changes)
; -- Fixed bug in force ignore during ramp (previously jumped from down to
; -- up state machine!)
; -- Added in complete force ignore at very slow part of ramp (need to change
; -- this to ignore when very close to limit)
; -- Removed that again
; -- Bug fix -- changed force skip during ramp-up. Before, it kept counting
; -- down the force ignore timer.
;
; Revision 0.28:
; -- Modified the wall control documentation
; -- Installed blinking the wall control on an IR reversal instead of the
; -- worklight
; -- Installed blinking the wall control when a pass point is seen
;
; Revision 0.29:
; -- Changed max. RPM timeout to 100 ms
; -- Fixed wall control blink bug
; -- Raised minimum speed setting

```

; NOTE: Forces still need to be set to accurate levels

; Revision 0.30:

- Removed 'ei' before setting of pcon register
- Bypassed slow-down to limit during learn mode

; Revision 0.31:

- Changed force ramp to a linear FORCE ramp, not a linear time ramp
 - Installed a look-up table to make the ramp more linear.
- Disabled interrupts during radio pointer match
- Changed slowdown flag to a up-down-stop ramping flag

; Revision 0.32:

- Changed down limit to drive lightly into floor
- Changed down limit when learning to back off of floor a few pulses

; Revision 0.33:

- Changed max. speed to 2/3 when a short door is detected

; Revision 0.34:

- Changed light timer to 2.5 minutes for a 50 Hz line, 4.5 minutes for a 60 Hz line. Currently, the light timer is 4.5 minutes WHEN THE UNIT FIRST POWERS UP.
- Fixed problem with leaving RF set to an extended group

; Revision 0.35:

- Changed starting position of pass point counter to 0x30

; Revision 0.36:

- Changed algorithm for finding down limit to cure stopping at the floor during the learn cycle
- Fixed bug in learning limits: Up limit was being updated from EEPROM during the learn cycle!
- Changed method of checking when limit is reached: calculation for distance to limit is now ALWAYS performed
- Added in skipping of limit test when position is lost

; Revision 0.37:

- Revised minimum travel distance and short door constants to reflect approximately 10 RPM pulses / inch

; Revision 0.38:

- Moved slowstart number closer to the limit.
- Changed backoff number from 10 to 6

; Revision 0.39:

- Changed backoff number from 8 to 12

; Revision 0.40:

- Changed task switcher to unburden processor
- Consolidated tasks 0 and 4
- Took extra unused code out of tasks 1, 3, 5, 7
- Moved aux light and 4 ms timer into task 6
- Put state machine into task 2 only
- Adjusted auto_delay, motdel, rpm_time_out, force_ignore, motor_timer, obs_count for new state machine tick
- Removed force_pre prescaler (no longer needed with 4ms state machine)
- Moved updating of obs_count to one ms timer for accuracy
- Changed autoreverse delay timer into a byte-wide timer because it was only storing an 8 bit number anyways...
- Changed flash delay and light timer constants to adjust for 4ms tick

; Revision 0.41

- Switched back to 4MHz operation to account for the fact that Zilog's 286733 CTF won't run at 6MHz reliably

; Revision 0.42:

- Extended RPM timer so that it could measure from 0 - 524 ms with a resolution of 8us

Revision 0.43:

- Put in the new look-up table for the force pots (max RPM pulse period multiplied by 20 to scale it for the various speeds).
- Removed taskswitch because it was a redundant register
- Removed extra call to the auxlight routine
- Removed register 'temp' because, as far as I can tell, it does nothing
- Removed light_pre register
- Eliminated 'phase' register because it was never used
- Put in preliminary divide for scaling the force and speed
- Created speedlevel AND IDEAL speed registers, which are not yet used

Revision 0.47:

- Undid the work of revisions 0.44 through 0.46
- Changed ramp-up and ramp-down to an adaptive ramp system
- Changed force compare from subtract to a compare
- Removed force ignore during ramp (was a kludge)
- Changed max. RPM time out to 500 ms static
- Put WDT kick in just before main loop
- Fixed the word-wise TOEXT register
- Set default RPM to max. to fix problem of not ramping up

Revision 0.48:

- Took out adaptive ramp
- Created look-ahead speed feedback in RPM pulses

Revision 0.49:

- Removed speed feedback (again)
NOTE: Speed feedback isn't necessarily impossible, but, after all my efforts, I've concluded that the design time necessary (a large amount) isn't worth the benefit it gives, especially given the current time constraints of this project.
- Removed RPM_SET_DIFF lo and hi registers, along with IDEAL_SPEED lo and hi registers (only need them for speed feedback)
- Deleted speedlevel register (no longer needed)
- Separated the start of slowdown for the up and down directions
- Lowered the max. speed for short doors
- Set the learn button to NOT erase the memory when jogging limits

Revision 0.50:

- Fixed the force pot read to actually return a value of 0-64
- Set the max. RPM period time out to be equivalent to the force setting

Revision 0.51:

- Added in P2M_SHADOW register to make the following possible:
- Added in flashing warning light (with auto-detect)

Revision 0.52:

- Fixed the variable worklight timer to have the correct value on power-up
- Re-enabled the reason register and stackreason
- Enabled up limit to back off by one pulse if it appears to be crashing the up stop bolt.
- Set the door to ignore commands and radio when lost
- Changed start of down ramp to 220
- Changed backoff from 12 to 9
- Changed drive-past of down limit to 9 pulses

Revision 0.53:

- Fixed RS232 '9' and 'F' commands
- Implemented RS232 'K' command
- Removed 'M', 'P', and 'S' commands
- Set the learn LED to always turn off at the end of the learn limits mode

Revision 0.54:

- Reversed the direction of the pot. read to correct the direction of the min. and max. forces when dialing the pots.
- Added in "U" command (currently does nothing)

```

; change nec ssitated this)
; -- Chang d down limit to add in 0.2" instead of 0.5"
;
; Revision 0.67:
; -- Removed minimum travel test in set_arev_state
; -- Mov d minimum distance of down limit from pass point from 5" to 2"
; -- Disabled moving pass point when only one pass point has been seen
;
; Revision 0.68:
; -- Set error in learn state if no pass point is seen
;
; Revision 0.69:
; -- Added in decrement of pass point counter in learn mode to kill bugs
; -- Fixed bug: Force pots were being ignored in the learn mode
; -- Added in filtering of the RPM (RPM_FILTER register and a routine in
;   the one ms timer)
; -- Added in check of RPM filter inside RPM interrupt
; -- Added in polling RPM pin inside RPM interrupt
; -- Re-enabled stopping when in learn mode and position is lost
;
; Revision 0.70:
; -- Removed old method of filtering RPM
; -- Added in a "debouncer" to filter the RPM
;
; Revision 0.71:
; -- Changed "debouncer" to automatically vector low whenever an RPM pulse
;   is considered valid
;
; Revision 0.72:
; -- Changed number of pulses added in to down limit to 0. Since the actual
;   down limit test checks for the position to be BEYOND the down limit
;   this is the equivalent of adding one pulse into the down limit
;
; Revision 0.74:
; -- Undid the work of rev. 0.73
; -- Changed number of pulses added in to down limit to 1. Noting the comment
;   in rev. 0.72, this means that we are adding in 2 pulses
; -- Changed learning speed to vary between 8/20 and 12/20, depending upon
;   the force pot. setting
;
; Revision 0.75:
; -- Installed power-up chip ID on P22, P23, P24, and P25
;   Note: ID is on P24, P23, and P22. P25 is a strobe to signal valid data
;         First chip ID is 001 (with strobe, it's 1001)
; -- Changed set_any routine to re-enable the wall control just in case we
;   stopped while the wall control was being turned off (to avoid disabling
;   the wall control completely)
; -- Changed speed during learn mode to be 2/3 speed for first seven seconds,
;   then to slow down to the minimum speed to make the limit learning the same
;   as operation during normal travel.
;
; Revision 0.76:
; -- Restored learning to operate only at 60% speed
;
; Revision 0.77:
; -- Set unit to reverse off of floor and subtract 1" of travel
; -- Reverted to learning at 40% - 60% of full speed
;
; Revision 0.78:
; -- Changed rampflag to have a constant for running at full speed
; -- Used the above change to simplify the force ignore routine
; -- Also used it to change the RPM time out. The time out is now set equal
;   to the pot setting, except during the ramp up when it is set to 500 ms.
; -- Changed highest force pot setting to be exactly equal to 500ms.
;
; Revision 0.79:
; -- Changed setup routine to reverse off block (yet again). Added in one pulse.
;
; Revision 1.0:

```

```

; -- Enabled RS232 version number return
; -- Enabled ROM checksum. Cleaned up documentation
;
Revision 1.1:
; -- Tweaked light times for 8.192 ms prescale instead of 8.0 ms prescale
; -- Changed compare statement inside setvarlight to 'uge' for consistency
; -- Changed one-shot low time to 2 ms for power line
; -- Changed one-shot low time to truly count falling-edge-to-falling-edge
;
Revision 1.2:
; -- Eliminated testing for lost GDO in set_up_dir_state (is already taken
;   care of by set_dir_state)
; -- Created special time for max. run motor timer in learn mode: 50 seconds
;
Revision 1.3:
; -- Fixed bug in set_any to fix stack imbalance
; -- Changed short door discrimination point to 78"
;
Revision 1.4:
; -- Changed second 'di' to 'ei' in KnowSimCode
; -- Changed IR protector to ignore for first 0.5 second of travel
; -- Changed blinking time constant to take it back to 2 seconds before travel
; -- Changed blinking code to ALWAYS flash during travel, with pre-travel flash
;   when module is properly detected
; -- Put in bounds checking on pass point counter to keep it in line
; -- Changed driving into down limit to consider the system lost if floor not seen
;
Revision 1.5:
; -- Changed blinking of wall control at pass point to be a one-shot timer
;   to correct problems with bad passpoint connections and stopping at pass
;   point to cause wall control ignore.
;
Revision 1.6:
; -- Fixed blinking of wall control when indicating IR protector reversal
;   to give the blink a true 50% duty cycle.
; -- Changed blinker output to output a constant high instead of pulsing.
; -- Changed P2S_POR to 1010 (Indicate Siminor unit)
;
Revision 1.7:
; -- Disabled Siminor Radio
; -- Changed P2S_POR to 1011 (Indicate Lift-Master unit)
; -- Added in one more conditional assembly point to avoid use of simradio label
;
Revision 1.8:
; -- Re-enabled Siminor Radio
; -- Changed P2S_POR back to 1010 (Siminor)
; -- Re-fixed blinking of wall control LED for protector reversal
; -- Changed blinking of wall control LED for indicating pass point
; -- Fixed error in calculating highest pass point value
; -- Fixed error in calculating lowest pass point value
;
Revision 1.9:
; -- Lengthened blink time for indicating pass point
; -- Installed a max. travel distance when lost
;   -- Removed skipping up limit test when lost
;   -- Reset the position when lost and force reversing
; -- Installed sample of pass point signal when changing states
;
Revision 2.0:
; -- Moved main loop test for max. travel distance (was causing a memory
;   fault before)
;
Revision 2.1:
; -- Changed limit test to use 11000000b instead of 10000000b to ensure
;   only setting up limit when we're actually close.
;
Revision 2.2:
; -- Changed minimum speed scaling to move it further down the pot. rotation.
;   Formula is now: ((force - 24) / 4) + 4, truncated to 12

```

```

; -- Changed max. travel test to be inside motor state machine. Max. travel
; test calculates for limit position differently when the system is lost.
; -- Reverted limit test to use 10000000b
; -- Changed some jp's to jr's to conserve code space
; -- Changed loading of reason byte with 0 to clearing of reason byte (very
; desperate for space)
;

```

Revision 2.3:

```

; -- Disabled Siminor Radio
; -- Changed P2S_POR to 1011 (Lift-Master)
;

```

Revision 2.4:

```

; -- Re-enabled Siminor Radio
; -- Changed P2S_POR to 1010 (Siminor)
; -- Changed wall control LED to also flash during learn mode
; -- Changed reaction to single pass point near floor. If only one pass point
; is seen during the learn cycle, and it is too close to the floor, the
; learn cycle will now fail.
; -- Removed an ei from the pass point when learning to avoid a race condition
;

```

Revision 2.5:

```

; -- Changed backing off of up limit to only occur during learn cycle. Backs
; off by 1/2" if learn cycle force stops within 1/2" of stop bolt.
; -- Removed considering system lost if floor not seen.
; -- Changed drive-past of down limit to 36 pulses (3")
; -- Added in clearing of power level whenever motor gets stopped (to turn off
; the FET's sooner)
; -- Added in a 40ms delay (using the same MOTDEL register as for the traveling
; states) to delay the shut-off of the motor relay. This should enable the
; motor to discharge some energy before the relay has to break the current
; flow)
; -- Created STOPNOFLASH label -- it looks like it should have been there all along
; -- Moved incrementing MOTDEL timer into head of state machine to conserve space
;

```

Revision 2.6:

```

; -- Fixed back-off of up limit to back off in the proper direction
; -- Added in testing for actual stop state in back-off (before was always backing
; off the limit)
; -- Simplified testing for light being on in 'set any' routine; eliminated lights
; register
;

```

Revision 2.7: (Test-only revision)

```

; -- Moved ei when testing for down limit
; -- Eliminated testing for negative number in radio time calculation
; -- Installed a primitive debouncer for the pass point (out of paranoia)
; -- Changed a pass point in the down direction to correspond to a position of 1
; -- Installed a temporary echo of the RPM signal on the blinker pin
; -- Temporarily disabled ROM checksum
; -- Moved three subroutines before address 0101 to save space (2.7B)
; -- Framed look up using upforce and dnforce registers with di and ei to
; prevent corruption of upforce or dnforce while doing math (2.7C)
; -- Fixed error in definition of pot_count register (2.7C)
; -- Disabled actual number check of RPM period for debug (2.7D)
; -- Added in di at test_up_sw and test_dn_sw for ramping up period (2.7D)
; -- Set RPM_TIME_OUT to always be loaded to max value for debug (2.7E)
; -- Set RPM_TIME_OUT to round up by two instead of one (2.7F)
; -- Removed 2.7E revision (2.7F)
; -- Fixed RPM_TIME_OUT to round up in both the up and down direction (2.7G)
; -- Installed constant RS232 output of RPM_TIME_OUT register (2.7H)
; -- Enabled RS232 'U' and 'V' commands (2.7I)
; -- Disabled constant output of 2.7H (2.7I)
; -- Set RS232 'U' to output RPM_TIME_OUT (2.7I)
; -- Removed disable of actual RPM number check (2.7J)
; -- Removed pulsing to indicate RPM interrupt (2.7J)
; -- 2.7J note -- need to remove 'u' command function
;

```

Revision 2.8:

```

; -- Removed interrupt enable before resetting rpm_time_out. This will introduce
; roughly 30us of extra delay in time measurement, but should take care of
;

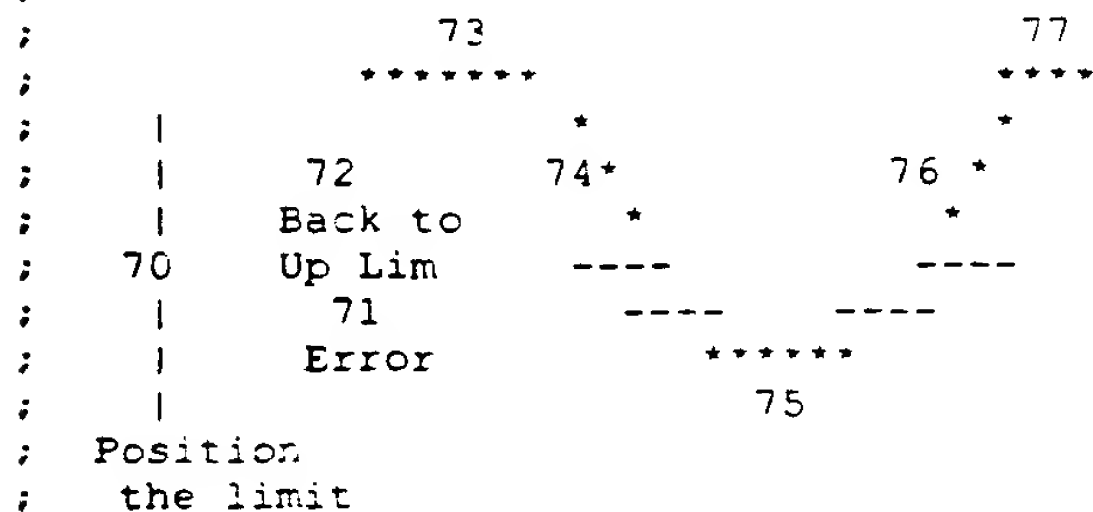

```

```

; nuisance stops.
; -- Removed push-ing and pop-ing of RP in tasks 2 and 6 to save stack space (2.8B)
; -- Removed temporary functionality for 'u' command (2.8 Release)
; -- Re-enabled ROM checksum (2.8 Release)
;

```

``` ; L_A_C State Machine ; ```

``` ; NON-VOL MEMORY MAP ; ```

RS232 DATA

REASON

```

00  COMMAND
10  RADIO COMMAND
20  FORCE
30  AUX OBS
40  A REVERSE DELAY
50  LIMIT
60  EARLY LIMIT
70  MOTOR MAX TIME, TIME OUT
80  MOTOR COMMANDED OFF RPM CAUSING AREV
90  DOWN LIMIT WITH COMMAND HELD
A0  DOWN LIMIT WITH THE RADIO HELD
B0  RELEASE OF COMMAND OR RADIO AFTER A FORCED
UP MOTOR ON DUE TO RPM PULSE WITHG MOTOR OFF

```

STATE

```

00  AUTOREVERSE DELAY
01  TRAVELING UP DIRECTION
02  AT THE UP LIMIT AND STOPPED
03  ERROR RESET
04  TRAVELING DOWN DIRECTION
05  AT THE DOWN LIMIT
06  STOPPED IN MID TRAVEL

```

DIAG

```

1) AOBS SHORTED
2) AOBS OPEN / MISS ALIGNED
3) COMMAND SHORTED
4) PROTECTOR INTERMITTENT
5) CALL DEALER
   NO RPM IN THE FIRST SECOND
6) RPM FORCED A REVERSE
7) LIMITS NOT LEARNED YET

```
